

**WEATHER: MAE across forecast horizons**  
**Fixed lookback = 168 steps**

| Forecast horizon | CNN    | LSTM   | dCeNN+ELM | dCeNN+ELM+ASP |
|------------------|--------|--------|-----------|---------------|
| 12.000           | 10.182 | 9.834  | 14.550    | 12.917        |
| 24.000           | 11.515 | 11.569 | 14.939    | 13.281        |
| 72.000           | 13.102 | 13.142 | 15.458    | 13.457        |

- This table keeps the input lookback fixed at 168 steps and shows how model error changes as the forecast horizon becomes longer.
- Lower is better. This is the average absolute difference between prediction and truth.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
