

WEATHER: sMAPE across forecast horizons
Fixed lookback = 168 steps

Forecast horizon	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
12.000	64.713	65.108	72.667	52.648
24.000	66.935	67.416	71.824	53.453
72.000	69.661	70.159	73.938	54.593

- This table keeps the input lookback fixed at 168 steps and shows how model error changes as the forecast horizon becomes longer.
- Lower is better. This is a percentage-style error that is easier to compare across scales.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
