

WEATHER: MAE across forecast horizons
Fixed lookback = 24 steps

Forecast horizon	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
12.000	9.994	9.489	11.177	9.392
24.000	11.596	10.390	12.148	10.287
72.000	12.771	12.114	13.896	11.895

- This table keeps the input lookback fixed at 24 steps and shows how model error changes as the forecast horizon becomes longer.
- Lower is better. This is the average absolute difference between prediction and truth.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
