

WEATHER: R2 across forecast horizons
Fixed lookback = 24 steps

Forecast horizon	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
12.000	0.989	0.989	0.988	0.989
24.000	0.987	0.987	0.987	0.987
72.000	0.986	0.985	0.984	0.985

- This table keeps the input lookback fixed at 24 steps and shows how model error changes as the forecast horizon becomes longer.
- Higher is better. Values closer to 1 mean the predictions follow the true pattern more closely.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
