

WEATHER: sMAPE across forecast horizons
Fixed lookback = 24 steps

Forecast horizon	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
12.000	64.495	64.550	66.006	39.844
24.000	66.816	66.783	68.151	43.299
72.000	69.261	69.101	71.031	48.510

- This table keeps the input lookback fixed at 24 steps and shows how model error changes as the forecast horizon becomes longer.
- Lower is better. This is a percentage-style error that is easier to compare across scales.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
