

WEATHER: MAE across forecast horizons
Fixed lookback = 72 steps

Forecast horizon	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
12.000	10.111	9.721	12.339	10.742
24.000	11.489	11.088	11.739	10.138
72.000	12.963	13.766	12.977	11.436

- This table keeps the input lookback fixed at 72 steps and shows how model error changes as the forecast horizon becomes longer.
- Lower is better. This is the average absolute difference between prediction and truth.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
