

WEATHER: sMAPE across forecast horizons
Fixed lookback = 72 steps

Forecast horizon	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
12.000	64.700	65.074	69.389	45.127
24.000	67.290	67.141	67.682	43.292
72.000	69.689	70.247	69.911	48.061

- This table keeps the input lookback fixed at 72 steps and shows how model error changes as the forecast horizon becomes longer.
- Lower is better. This is a percentage-style error that is easier to compare across scales.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
