

WEATHER: RMSE across lookback settings
Fixed forecast horizon = 12 steps

Lookback	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
24.000	33.629	33.965	35.517	34.479
72.000	33.550	34.689	38.054	37.123
168.000	33.800	34.553	75.339	67.287

- This table keeps the forecast horizon fixed at 12 steps and shows how model error changes when the lookback window changes.
- Lower is better. Large mistakes are penalized more strongly than in MAE.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
