

WEATHER: sMAPE across lookback settings
Fixed forecast horizon = 12 steps

Lookback	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
24.000	64.495	64.550	66.006	39.844
72.000	64.700	65.074	69.389	45.127
168.000	64.713	65.108	72.667	52.648

- This table keeps the forecast horizon fixed at 12 steps and shows how model error changes when the lookback window changes.
- Lower is better. This is a percentage-style error that is easier to compare across scales.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
