

WEATHER: RMSE across lookback settings
Fixed forecast horizon = 24 steps

Lookback	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
24.000	37.300	36.684	37.478	36.393
72.000	36.866	37.689	36.418	35.589
168.000	36.485	38.199	43.531	42.440

- This table keeps the forecast horizon fixed at 24 steps and shows how model error changes when the lookback window changes.
- Lower is better. Large mistakes are penalized more strongly than in MAE.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
