

**WEATHER: sMAPE across lookback settings**  
**Fixed forecast horizon = 24 steps**

| Lookback | CNN    | LSTM   | dCeNN+ELM | dCeNN+ELM+ASP |
|----------|--------|--------|-----------|---------------|
| 24.000   | 66.816 | 66.783 | 68.151    | 43.299        |
| 72.000   | 67.290 | 67.141 | 67.682    | 43.292        |
| 168.000  | 66.935 | 67.416 | 71.824    | 53.453        |

- This table keeps the forecast horizon fixed at 24 steps and shows how model error changes when the lookback window changes.
- Lower is better. This is a percentage-style error that is easier to compare across scales.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
