

WEATHER: RMSE across lookback settings
Fixed forecast horizon = 72 steps

Lookback	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
24.000	39.009	39.313	40.841	39.671
72.000	39.634	42.576	39.317	38.604
168.000	39.756	41.390	62.072	53.116

- This table keeps the forecast horizon fixed at 72 steps and shows how model error changes when the lookback window changes.
- Lower is better. Large mistakes are penalized more strongly than in MAE.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
