

WEATHER: sMAPE across lookback settings
Fixed forecast horizon = 72 steps

Lookback	CNN	LSTM	dCeNN+ELM	dCeNN+ELM+ASP
24.000	69.261	69.101	71.031	48.510
72.000	69.689	70.247	69.911	48.061
168.000	69.661	70.159	73.938	54.593

- This table keeps the forecast horizon fixed at 72 steps and shows how model error changes when the lookback window changes.
- Lower is better. This is a percentage-style error that is easier to compare across scales.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
