

**Performance relative to the persistence baseline for WEATHER**  
**Lookback = 72 steps, Forecast horizon = 24 steps**

| Model         | RMSE / persistence | MAE / persistence | RMSE gain    | BASE_RMSE | BASE_MAE |
|---------------|--------------------|-------------------|--------------|-----------|----------|
| CNN           | 0.295              | 0.299             | 0.705        | 125.043   | 38.395   |
| LSTM          | 0.301              | 0.289             | 0.699        | 125.043   | 38.395   |
| dCeNN+ELM     | 0.290              | 0.304             | 0.710        | 125.466   | 38.569   |
| dCeNN+ELM+ASP | <b>0.284</b>       | <b>0.263</b>      | <b>0.716</b> | 125.466   | 38.569   |

- These ratios compare each model with the persistence baseline. Values below 1.0 for RMSE/MAE ratios mean the model beats persistence.
- Persistence is a simple forecast that repeats the last observed value forward.
- Weather combines multiple physical variables. Aggregate RMSE or MAE should therefore be read mainly as a model-comparison tool, not as a single physical-unit error.
